Lab 1: Introduction to AWS IAM

AWS Identity and Access Management (IAM) is a web service that enables Amazon Web Services (AWS) customers to manage users and user permissions in AWS. With IAM, you can centrally manage **users**, **security credentials** such as access keys, and **permissions** that control which AWS resources users can access.

Lab overview and objectives

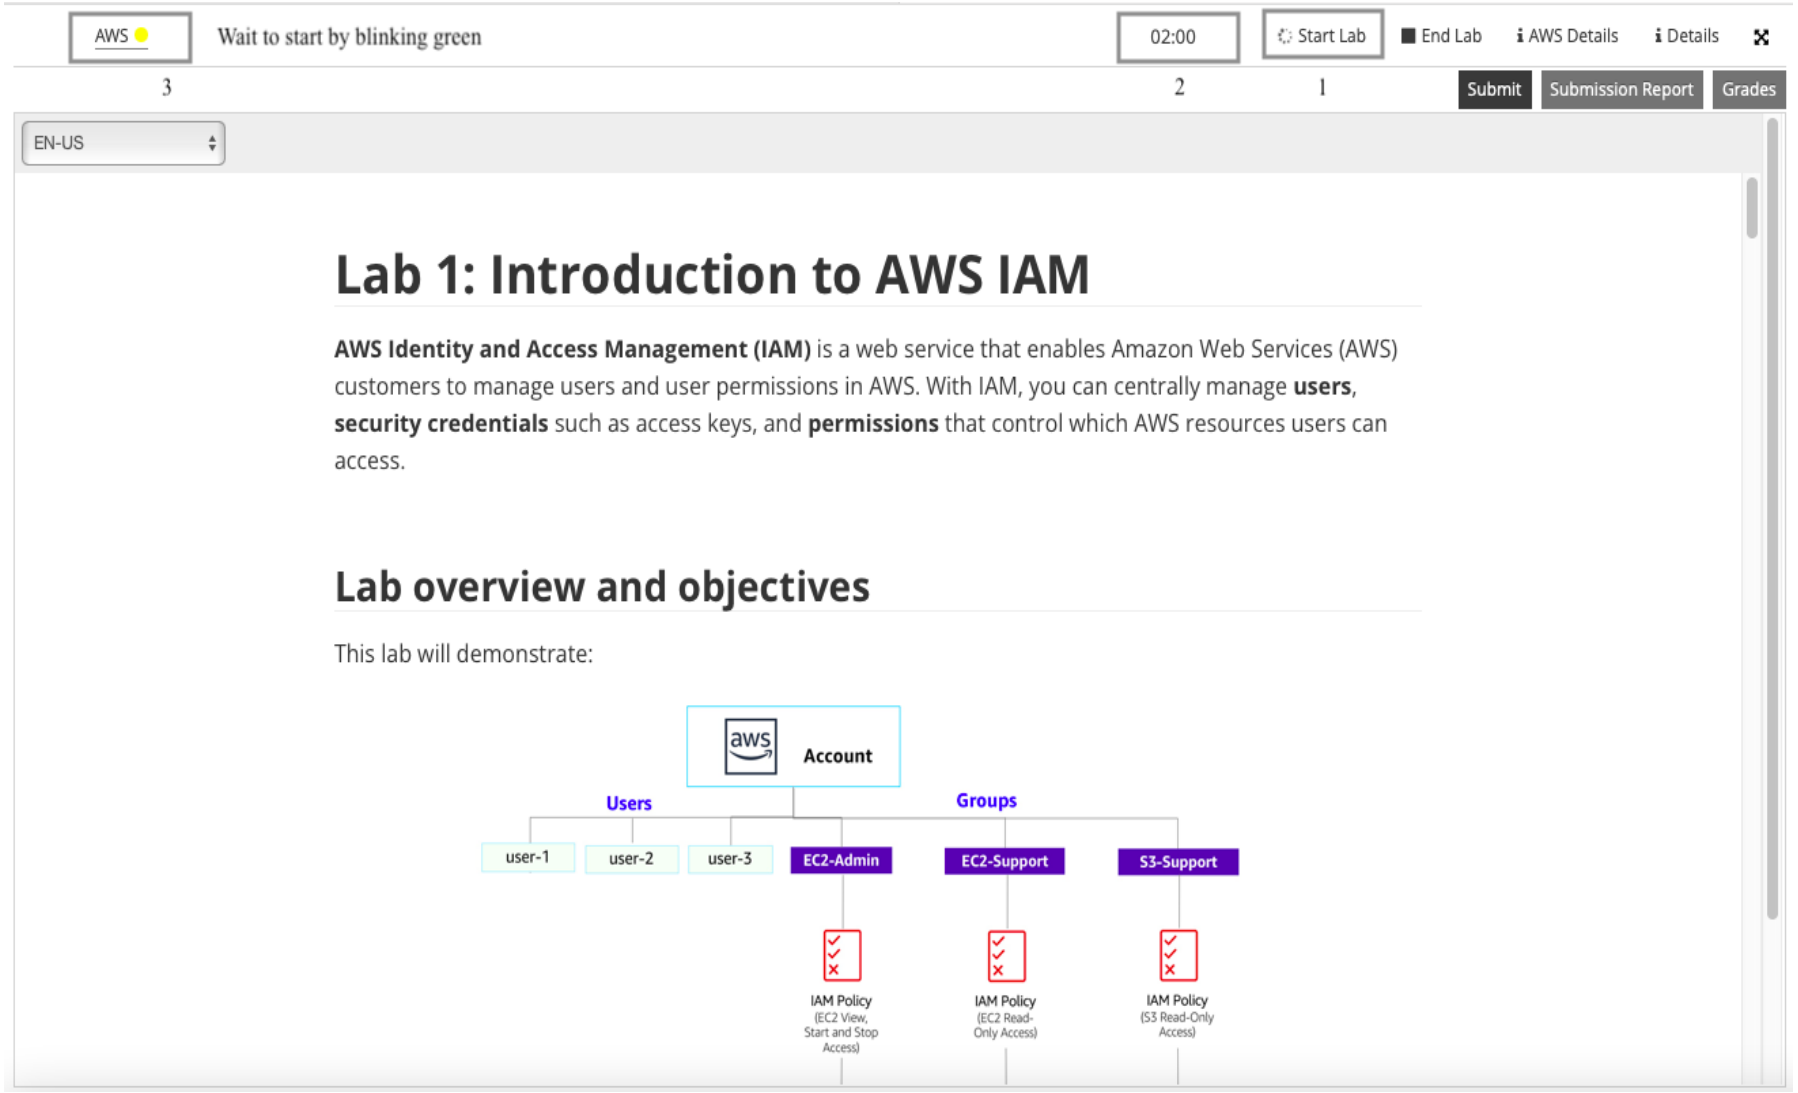

This lab will demonstrate:

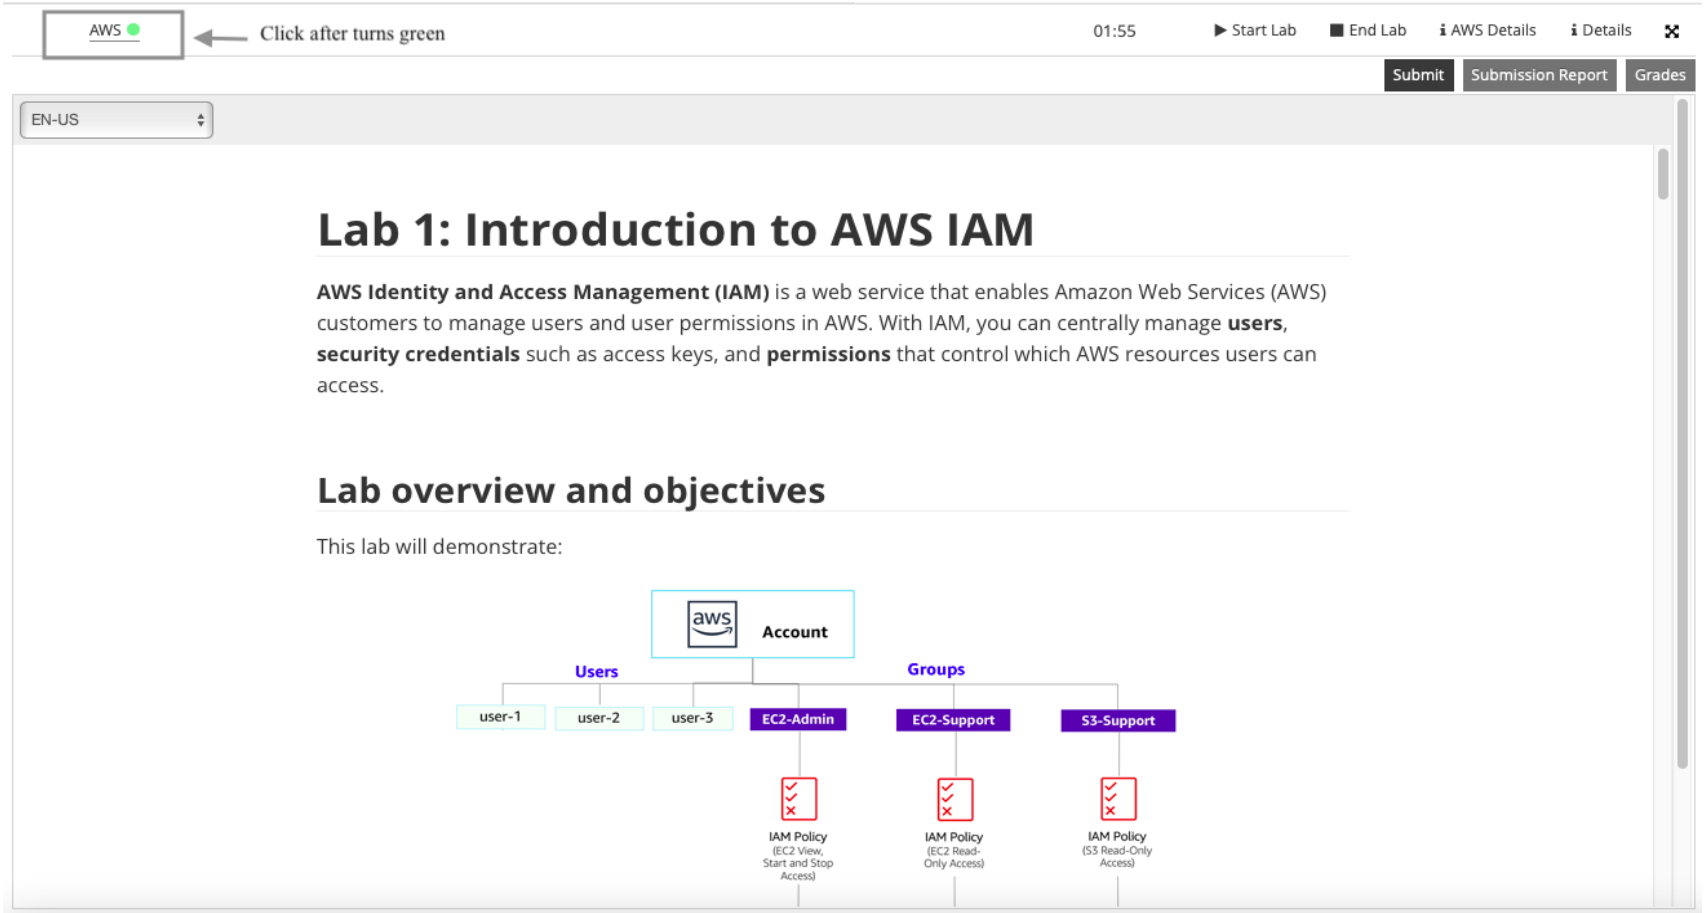

Step 10: Now start the AWS lab session by following the steps below.

Accessing the AWS Management Console

1. At the top of the window, choose **Start Lab**.
   - The lab session starts.
   - A timer displays at the top of the page and shows the time remaining in the session.
   - **Tip:** To refresh the session length at any time, choose **Start Lab** again before the timer reaches 0:00.
   - Before you continue, wait until the circle icon to the right of the AWS link in the upper-left corner turns green.

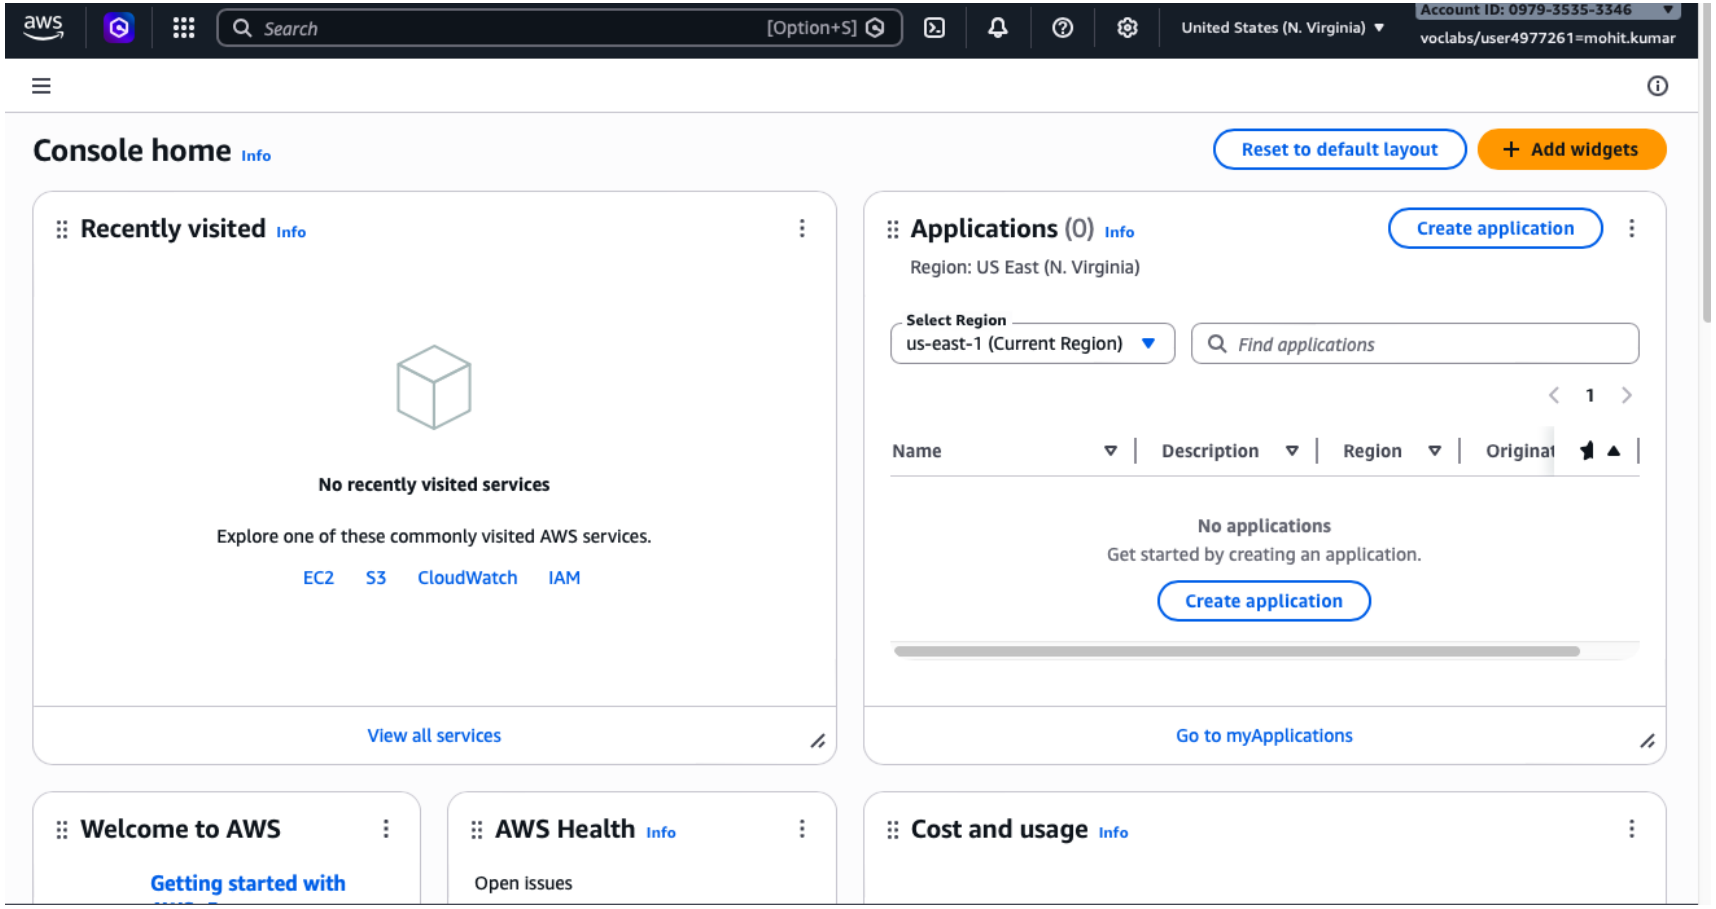

2. To connect to the AWS Management Console, choose the **AWS** link in the upper-left corner.
    - A new browser tab opens and connects you to the console.
    - **Tip:** If a new browser tab does not open, a banner or icon is usually at the top of your browser with the message that your browser is preventing the site from opening pop-up windows. Choose the banner or icon, and then choose **Allow pop-ups**.

3. Arrange the AWS Management Console tab so that it displays along side these instructions. Ideally, you will be able to see both browser tabs at the same time, to make it easier to follow the lab steps.

Now consider the Assignment_1 documents to explore the AWS environment by following different tasks. To perform each task for assignment 1 steps are given. Follow that steps and practice.

Step 10: End the lab

After completing assignment End the lab
